

Project Information

Builder-Owner

Landesregierung Steiermark

Location

Murau

Completion

1995

Project facts

n.b.ar. 300,00 m²,
GFA 300,00 m²,
GBV 3.000,00 m³

An example of the functionality and versatility of timber.

Very often when timber is discussed in the press its versatility, cost effectiveness and functionality as a building material are often forgotten, instead the focus is often on the aesthetics and not the viability. The exhibition hall is designed to take away the prejudices of visitors has with regards to the building material.

Quite deliberately the interior is very reserved. It is a simple, light-flooded timber container. There should be no competition with the exhibition at all. The unit, as well as the possibilities of general timber construction, are significantly influenced by new "timber products". This was the theme for the Exhibition Hall: Murau, as part of the Styrian show "Holzzeit".

For the roof construction of the Exhibition Hall is the Canadian Intralamplatte (veneer strip timber) with the standard format 2.44 x 10.67 m and thicknesses of 25-140 mm. The floor and walls are designed as ribbed panels made of 3-layer laminate, as are the canopies, which take over the horizontal reinforcement of the building. The entire structure can easily be disassembled into 2.40 m wide elements and rebuilt.
